

● **Two-Part Adjustable Anchors**

The system is equipped with two-piece anchor components that ensure strong and secure attachment to the concrete substrate. These anchors are adjustable to suit the geometry of the building, offering ease of alignment and enhanced adaptability on-site.

● **Vertically Embedded Holder Profiles**

One of the most distinctive aspects of the system is the use of vertically embedded aluminum holder profiles within the flooring. The design includes four modular profiles—two concave and two convex—each in a two-part structure, allowing for durable integration and efficient assembly.

Durable and Low Maintenance:

Resistant to rust and weather conditions, aluminum railings last for years with minimal upkeep
